Four years, built.

From frontline client support to operations leadership, I built the processes, teams and systems that made service more consistent and day-to-day work easier to see and manage.

Prepared 19 October 2026 | Agreed last working day: 30 November 2026. This report captures work through 19 October; transition support will continue through my final day.

~20 agents personally hired and trained	**6,000+** client interactions per month at operating scale	**3.4 -> 5/5** early client-rating improvement	**60%+** reduction in client wait time after chat routing
41 pages first company training reference	**~30 / 5** people / functions in current operating scope	**3,277 / 2** reviews / working days in compliance run	**40+ / 2** videos / months of content production

The arc

PERIOD	WORK
Apr 2022 - May 2023	Client Service Quant: direct client support, strategy troubleshooting and early training ownership.
May 2023 - 2026	Team Lead: hiring, training, support operations, quality, escalations and operating processes.
From around 2024	Started the Operations Hub as a self-initiated project alongside day-to-day operations.
June 2026	Promoted to Manager, Operations & Customer Support; Operations Hub went live in production.
September 2026	Designed and introduced a recurring process for high-volume compliance description review.

Where the work landed

PEOPLE
Hiring, training, coaching and leadership across support functions.

PROCESSES
Client support, quality, escalation and compliance workflows.

SYSTEMS
Operations Hub and tools for work visibility and follow-through.

Building the service operation

I joined Tradetron without a background in trading or the platform and learned through real client cases. I supported clients on a platform serving more than 50,000 active users, helping them build and troubleshoot algorithmic strategies. During a period in voice support, I handled 20-30 inbound calls a day and was requested by name by returning clients.

As the support function grew, my responsibilities expanded to hiring, onboarding, training, quality assurance, performance management and escalations. I personally hired and trained around 20 agents. I built the end-to-end support process and helped establish the strategy-creation process, supported by individual coaching and formal quality measures.

Client outcomes

3.4 -> 5/5
early CSAT after structured training and coaching

3.0 -> 4.0+
later average CSAT as the operation scaled

10+ -> <5 min
later average first-response time

60%+
client wait-time reduction after chat routing

The early training and feedback-coaching loop raised client ratings from 3.4/5 to 5/5. Later workflow and quality changes helped raise average CSAT from 3.0 to 4.0+ and bring average first response time from over 10 minutes to under 5 minutes. The chat-routing workflow reduced client wait time by more than 60%. These are separately time-scoped results from different stages of the operation.

Processes I put in place

- Designed inbound call handling and escalation workflows, including clearer ownership, routing and closure.
- Created an escalation tracker, agent audit process, KPI framework and regular reporting on client queries and team performance.
- Ran additional training for the inbound support team; recorded escalations fell, with no measured percentage in the source records.
- Handled complex client escalations and supported B2B and white-label partners, including direct onboarding and training for business stakeholders.
- Set written communication and client-handling standards, then coached agents to apply them in real cases.

Manager scope

Since June 2026, my operating scope has covered around 30 people across five functions: chat and email support, strategy creation, white-label support, inbound calls and outbound sales. I have worked across Product, Engineering, Marketing and external partners to turn operating questions into analysis, implementation plans and follow-through.

From manual work to shared systems

Operations Hub | Production since June 2026

I identified that spreadsheets and separate tools made it difficult to see assignments, client history and team activity in one place. I defined the business requirements and workflows, then directed AI-assisted development, reviewing and testing features against actual operating needs before deciding what shipped.

The Hub brought together role-based dashboards, chat and email assignments, resolution tracking, a customer CRM, leave management, task and working-hours tracking, notifications and access controls. It replaced spreadsheet-based workflows across several support functions and created a shared operating record for the teams using it. The Hub is in production and supports daily operational workflows.

Measured build footprint | 14 September 2026

1,104 commits in repository; 1,102 by me	**3,043** test functions across four test tiers	**78 / 87** database tables / migrations	**883** tracked files in the project

These figures measure the system's scale. The build used AI assistance under my direction and review.

Support, training and reporting systems

- Wrote the company's first 41-page, six-module training reference from recurring client questions and platform workflows. It remains in use for onboarding and training.
- Built and debugged strategy logic with clients, including Python logic using Tradetron's pre-defined functions where the standard builder did not cover the need.
- Built a structured onboarding and coaching process that connected client feedback to agent development.
- Created agent audits, KPI reporting, workload and query analysis, and monthly management reporting to support hiring and product decisions.
- Established chat assignment and escalation tracking so work had clearer ownership and follow-through.
- Built a companion Android call-tracking app to record client calls handled from agents' phones.

How I led the build

I owned the problem definition, operating workflows and product decisions. The software was developed with AI assistance under my direction and review. I tested components against real operating cases and made the decisions about what was ready to ship. The work was built for production use, rather than as a concept or demo.

Other process work

Across the support operation, I replaced informal or disconnected practices with repeatable workflows for onboarding, quality review, escalations, call handling, workload visibility and follow-up. The intent was to make the right process straightforward for the people doing the work.

Work beyond the support queue

Description-review automation | September 2026

I wrote the review rules and designed the risk controls for an automation-assisted compliance process. The initial run reviewed 3,277 creator-submitted descriptions over two working days and emailed 1,657 creators, with decisions logged for audit. The work cleared the backlog and became a recurring weekly process. Ambiguous records could be skipped for review rather than decided without sufficient confidence.

Product pilot evidence review | August-September 2026

I reviewed evidence from a major product pilot, including 103 completed tests and 68 published reports. I separated work marked complete from work with a recorded, re-checkable result, grouped reported issues into root patterns, and wrote a decision-ready summary that stated what the evidence could and could not establish. The report identified retests needed before stronger conclusions could be drawn.

Website search and migration planning | 2026

I initiated a nine-part review of the company website's search performance and prepared an executive findings report covering 68 issues. I used search, analytics and site data for technical and content analysis, then coordinated selected fixes. For a same-domain rebuild, I prepared an implementation plan with 61 tasks across nine deliverables and four rollout phases.

Ongoing growth analysis

I created a monthly claim-check process that compared agency reporting with source data. In one cycle, it tracked 24 claims against independently pulled search, analytics and site information. I also ran competitor growth analysis, reviewed product usability against competing tools, and worked on utility pages intended to grow search traffic.

Educational content

I established and led a content-creation sub-team supporting SEO and marketing. The team produced more than 40 educational YouTube videos in two months and launched the Tradetron US YouTube channel. I reviewed AI-generated scripts and outputs before publication.

In progress at this snapshot

- A customer and revenue attribution layer within the Operations Hub is being developed to connect acquisition, conversion, retention and service work. It is not yet complete.
- A formal bug-reporting system is also in progress and should be handed over with its current status and next steps.

Closing note

I am grateful for the opportunities and trust I received at Tradetron. I am proud of the work I was able to contribute: supporting clients directly, helping build and lead teams, creating operating processes, and turning recurring needs into systems people can use. I will support a clear handover of the ongoing work before my agreed last working day on 30 November 2026.

Prepared from my career records and resume source. Metrics are time-scoped; unfinished work is labeled as in progress.
